

Project Morrowfield: Methodology Appendix

Protocol BWU-03-118 | Internal working document | 03 September 2003

Purpose

Project Morrowfield evaluates whether repeated exposure to a coherent, fabricated municipal history changes the confidence and detail of autobiographical recall. The study uses a controlled archive of maps, photographs, newspaper extracts, and civic records describing the fictional town of Morrowfield.

Participant sequence

Each participant is assigned a randomized packet order, reviewed under supervised conditions, and interviewed after an initial exposure period. Follow-up sessions use standardized prompts. Session records are indexed by filing date, then by the alphanumeric log number assigned at intake.

Materials register

Register	Description	Control
A	Municipal history, founding minutes, address cards	sealed
B	Street map, landmarks, transit route diagrams	sealed
C	Festival photographs and caption sheets	sealed
D	Simulated newspaper extracts and index cards	sealed

Appendix A: Personnel and records handling

The public project listing identifies faculty and laboratory staff. The following operational appointments are retained in the protocol copy because they controlled the study materials and archival sequence.

Appointment	Assignment	Scope
E. Harrow	Records contractor	Archive construction, log normalization, and retention index
N. Bell	Research assistant	Scheduling and consent packet intake
J. Reed	Graduate researcher	Materials coding and interview transcription
M. Calder	Faculty sponsor	Ethics review and protocol amendments

Records procedure

The records contractor receives completed session sheets after each interview, assigns a project-day reference, and prepares a redacted copy for the research team. Only the principal investigator may alter a filed record. The contractor is not listed as study personnel on public-facing project pages.

Version control

Backup copies are created before participant activity begins and checked weekly. Working copies may retain incomplete staff initials; the protocol copy preserves role descriptions for audit purposes.
